GtCCR4, a channelrhodopsin with high light sensitivity

---

Genetic delivery of photoreceptor genes to cells and tissues originally light insensitive turns into light-sensitive. This technique, optogenetics, has been applied in the manipulation of biological function with unprecedented spatio-temporal precision. Channelrhodopsins (ChRs) found in chlorophyte and cryptophyte alga are directly light-gated ion channels and have been widely applied to optogenetics tools for manipulating neuronal excitability. Furthermore, the optogenetics approach has great potential for the restoration of visual function from an inherited disease, retinitis pigmentosa, in which the patient loses light response of the retina.

In 2017, we identified phylogenetically distinct cation-conducting ChR (GtCCR4) from the cryptophyte algae *Guillardia theta* and investigated its molecular property by spectroscopy and electrophysiology (1).

One of the striking features of GtCCR4 is its high photo-sensitivity, ~25 folds higher than a widely known ChR2, without losing fast time response. Thus, GtCCR4 is able to trigger action potentials in high temporal resolution, similar to ChR2, but requires lower light power when expressed in neurons (2, 3). Inspired by such marked properties of GtCCR4, we launched a start-up company aiming for developing an effective gene therapy for curing retinitis pigmentosa.

## 企業参画型ピッチコンテスト

---

**主 催：**株式会社リバネス  
**共 催：**日本生物物理学会  
**日 時：**11月14日（火）10:00～11:30  
**会 場：**1号館3階K会場

本企画は、研究成果を何かの形で社会還元したいという想いをもつ研究者が自らの研究とアイデアを協賛企業に向けてプレゼンし、産学間でディスカッションや連携を創出するための接点を多く生み出すことを目指すものです。

---

### 概 要：

- ・ピッチコンテストにて、研究者が産業界に向けて自身の研究アピールを3分でピッチ（ショートプレゼンテーション）する（50名程度、事前募集制）。
- ・事前に応募のあった企業参加者が、ピッチとともに各発表者のポスター発表を聞きに行き、その場でディスカッションを行う。両方の結果に基づき、各参加企業が自身の企業賞を授与する研究者を決定する。
- ・年会最終日の閉会式にて、各企業賞を発表・授与するピッチコンテストの審査は、この企画に賛同をいただいている協賛企業各社にお願いした方に行っていただき、優秀発表者には協賛企業からの賞金が出ます。

Details of the special project, Company-involved Pitch Contest, are as follows:

Date and Time: November 14th (Tue), 10:00–11:30

Venue: Room K

Hosted by: Leave a Nest Co., Ltd.

Co-sponsored by: Biophysical Society of Japan

The flow of the pitch contest (scheduled) is as follows:

- Researchers will pitch their research appeal to the industrial sector in a short presentation format lasting 3 minutes (approximately 50 people, by advance registration)
- Participating companies who have applied in advance will attend the poster presentations of the presenters along with their pitch, and discussions will be held on the spot. Based on the results of both, each participating company will decide which researcher to award their company prizes to.
- Each company prize will be announced and presented at the closing ceremony of the annual meeting.

1YI 日本生物物理学会若手奨励賞選考会

Early Research in Biophysics Award Candidate Presentations

オーガナイザー：男女共同参画・若手支援委員会

**Organizer: Promotion of Gender Equality and Young Researchers Committee**

Biophysical Society of Japan (BSJ) grants “Early Career Award in Biophysics” and “Early Career Presentation Award” to young BSJ members for their excellent presentations that show great potential to contribute to the progress of biophysics. In this 19th year, we received 41 highly qualified applications. After the first round of competitive screening based on submitted documents, the following ten applicants were selected as candidates for Early Career Award in Biophysics. In this symposium, each speaker will give a 10-minute presentation followed by a 3-minute discussion as the second round of screening. Up to five awardees of the Early Career Award in Biophysics will be selected. The best presenter will also be awarded IUPAB award from International Union of Pure and Applied Biophysics. The Early Career Presentation Award will be given to the rest of the excellent invited speakers. We welcome all the BSJ members to attend this symposium to foresee the future of biophysics in Japan through the speakers and their research.

The applications of AI in biological and medical fields have been rapidly progressing in these decades. In particular, the structural prediction by AlphaFold2 drastically changed the situation of structural biology. The application of AI, however, in other fields is not so established, and many drastic developments are still being demanded. In this symposium, we will present cutting-edge studies incorporating both AI and experiments in a complementary manner for biological and chemical applications. Given the current situation in each discipline, we will discuss the future perspective of biological discovery and paradigm shift by integrating AI and experimental approaches.

Recent advances of experiments have revealed the multiscale structure and dynamics of eukaryotic genome. Genome forms domains, such as topologically associated domains and compartments, in the mesoscopic length scale (100k-10Mbps) and the dynamics of SMC proteins plays a key role in assembling such domains. In this symposium, we invite experts of the dynamics of chromatin and SMC proteins and the self-assembly of DNA to discuss the biophysical principle behind the structural formation and dynamics of genome.

Cells are compartmentalized by various planer boundaries. At each boundary (e.g., the plasma membrane, the nuclear envelope, and organelle surfaces), cytoskeletal proteins form filamentous meshworks and act dynamically to control cell physiology. Whereas the propensities of individual cytoskeleton and membrane components have been extensively studied, how they work together remains a mystery. This symposium gathers early-career researchers from diverse disciplines, aiming to illuminate the fascinating interplay at these biological boundaries. We envision that the symposium provides an opportunity to foster new ideas and questions that encourage young scientists and promotes exciting biophysics by crossing the interdisciplinary boundaries.

Rhodopsin is a general term for photoreceptive proteins which bind retinal as a chromophore. Rhodopsins are classically classified into two types, animal-type and microbial-type. These two types show no sequence similarities with each other, which leads to the diversity of their molecular functions. However, recent accumulation of the molecular properties of rhodopsins has crossed the border between animal-type and microbial-type. Moreover, the application of various rhodopsins to optogenetics not only contributes to the understanding of the molecular mechanisms underlying the physiological functions in animals but also opens a new field in the treatments of diseases. In this symposium, we would like to introduce the “borderless” rhodopsin world.

High-speed AFM has been a unique experimental method that can observe single biomolecular structural dynamics at near physiological condition. However, AFM data directly provide information of the surface envelope of the specimen at intermediate resolution both in time and space so that the underlying three-dimensional structures and their movements need to be inferred from some computations for quantitative analysis. The workshop focuses on recent efforts towards integration of high-speed AFM measurements and information technology (IT)-based methods that are expected to make high-speed AFM methods more powerful in the coming years.

Response of an organism to external stimuli is an essential step for adaptation to external environment. The response relies on that of cells, biomolecules, and their network. In this symposium, we explore the interactions between organisms and environment throughout the spatial scales. We begin with speakers who examine heat and thermal responses at the scales of atoms, molecules and cells. Their interdisciplinary approaches span over biophysics, computational chemistry, and material science. Next, quantitative fluorescence imaging of kinase activities will be introduced as a representative intracellular signaling that can be perturbed quickly by thermal stimulus. Lastly, we will learn how the organism-environment interactions have been examined successfully by state-of-the-art robots as a constructive approach. This symposium is suitable for those who are interested in interdisciplinary approaches to examine the interaction of biological systems with environment at any spatial scales of biological systems.

Life at the molecular levels is modulated by the dynamics and interactions of biological molecules. To understand them, single molecule techniques is straight-forward way to investigate in details. Among the techniques, nanopore sensing is a label-free/high through-put approach, which measure a modulation of ionic current passing through a nanopore. In this symposium, we will organize the session to boost adoption of nanopore sensing and co-develop advanced solutions in biophysical community. To provide deep-understanding of the sensing, the symposium consists of two parts: how the nanopore sensing work fundamentally and how this sensing can be used for applications.

An embryo produces cells with specific fates, forms, and functions during development. These cells are self-organized into an ordered pattern through collective interactions of biomolecules and mechanical forces at various spatio-temporal scales. We aim at developing new paradigms of the fundamental design principles of biological systems through holistic understanding of how mechanical forces elicit self-organizing feedback leading to progressive self-tuning transformation of multicellular systems. In this symposium, cutting-edge technologies needed to interrogate the mechanical processes and establish a unique model for multi-disciplinary research that harnesses expertise from biomedical sciences, engineering, mathematics, physics, and chemistry will be focused.

Molecular cybernetics aims to develop artificial molecular information processing systems (Chemical AI) by connecting multiple molecular units that package functional molecules acting as sensors, processors, and actuators. On the other hand, plant cells have simple information processing systems without a central nervous system that may provide inspiration for the design of Chemical AI. In this symposium, molecular cybernetics researchers and plant cell biologists will discuss and explore ideas for designing chemical AI inspired by plant cells, and for applying the fundamental techniques of molecular cybernetics to plant cell research ranging from imaging to reconstruction experiments.

Cells contain multi-layered supramolecular assemblies ranging from nanometer- to micrometer-scale structures such as protein complexes, RNA-protein complexes, liquid droplets, and organelles. These ordered and dynamic structures orchestrated by tons of molecules convey complex biological information to regulate various key functions in diverse biological processes. Insights into spatiotemporal dynamics of each supramolecular assembly must thus be getting important to understand the rich behaviors of cells. Accordingly, technologies to approach the dynamics of supramolecular assemblies have been explosively diversified in recent biology. In this symposium, we will invite talented early-career researchers from various relevant research fields and discuss the dynamic function of multi-layered supramolecular assemblies.

In cells, the solution environment is constantly changing due to varying concentrations of chemicals, mechanical stimuli, and electric fields. In recent years, it has become evident that intrinsically disordered proteins, which do not have specific conformations, undergo liquid-liquid phase separation and amyloid fibrillization in response to the ‘dynamic’ solution environment. In this workshop, we invite researchers who are taking various approaches to the effect of dynamic solution environment on protein structure, function, and aggregation and discuss future developments.

Response of cells for environments is one of the interesting topics in biology. Target of Rapamycin (TOR) complexes play central roles on signaling pathways for cells to appropriately respond to change in their environment, such as nutritional status, and also known to be associated with various diseases. To uncover the mechanisms, a variety of approach for cells of various species will be of crucial importance. In this symposium, by inviting talented early-career researchers in various research fields who are developing cutting-edge approaches to research the function of TOR complexes, we would like to introduce new attractive target to the Biophysical Society of Japan.

## 2SCA 多彩なアプローチによるイオンチャネル研究

Invitation to Ion Channel Research

オーガナイザー：川鍋 陽 (香川大学), 細島 頌子 (名古屋工業大学)

Ion channels are a large and diverse group of membrane proteins that can open and close in response to various stimuli such as membrane potential, ligand, pH and light. Thus, ion channels play an essential role in signal transduction in nerve, muscle and brain by regulating the electrical activity of cells. Recently, many types of ion channels including channelrhodopsins, have been used to manipulate biological phenomena. However, many important questions about ion channels such as gating, ion selectivity and transport mechanisms, remain unresolved. In this symposium, we would like to introduce the latest and most interesting ion channel research.

Microorganisms use their own motility apparatus to move in a variety of environments. The motility apparatus is a highly dynamic and robust protein complex containing motor proteins that convert electrochemical or chemical energy to mechanical action for movement. Because motor-protein complexes are under the control of complex sensory signal transduction networks, microorganisms can migrate towards environments favourable for survival and away from unfavourable environments. Furthermore, motor-protein complexes autonomously adjust their mechanical functions in response to environmental changes. In this symposium, we would like to discuss the molecular mechanisms behind these processes and to clarify the design principles common to seemingly diverse motility.

Understanding the morphology, function, and dynamics of genomes and molecular complexes of individual extremophiles is progressing as survival strategies in various extreme environments. On the other hand, a metagenomic-based exploration of more extreme environments reveals the importance not only of independent survival strategies of individual organisms but also of cooperative survival strategies through interactions between coexisting heterologous organisms. This project will observe the molecular complexes of morphology, function, dynamics, and their associated biological interactions of viruses, prokaryotes, and eukaryotes living in extreme environments, and elucidate the simple or minimal mechanisms and principles. We will connect these to a systematic understanding of the boundary between matter and life.

Various "pressure stimuli" such as hydrostatic pressure, osmotic pressure, and compressive force regulate a variety of biological functions from the molecular system to the tissue level. Recent studies have shown that pressure stimulus signaling elicits a wide range of cellular responses, providing new insights into biological and biomedical research areas. In this symposium, we will present and discuss recent studies on how pressure stimuli regulate biological function. We will also introduce the emerging field of Pressure Biology.

Membrane transport proteins play essential roles in many physiological functions, such as maintenance of concentration gradients, nerve conductions, and synthesis of ATP. In principle, molecular motion should be involved in these functions, and observation of such molecular motion is necessary to fully understand their mechanisms. Recent computational simulations using high-performance computers have made it possible to fundamentally explain such functions at the molecular level. In this symposium, we will present recent advances in this field that help us understand (1) ion conduction and selectivity mechanism through the ion channels, (2) those through the ion pumps, (3) alternating-access conformational dynamics of transporters.

This is a series of motor protein symposia, starting in 2021, that will bring together researchers from Japan and the U.S.-two leading countries in the field- to foster the exchange of ideas and promote cutting-edge collaborative research. With a lineup of renowned experts in the field, this symposium provides an exceptional opportunity to present the latest advances in our understanding of motor protein movement and regulation. This time, we are especially featuring international young scientists as speakers who are also willing to contribute to the educational programs of IUPAB2024. In addition, the symposium will promote gender equality by providing an opportunity for discussion as part of the introduction of the speakers.

There are various time scales in biology such as longevity, seasonal responses, circadian rhythmicity, developmental processes, cell division cycles, and heartbeats. In other words, living organisms consists of different time scales. What are the mechanisms for measuring “time” that correspond to each event at different time scale? This symposium is co-organized with Transformative Research Areas (B) "Chronoproteiniology". We will focus on proteins responsible for molecular mechanisms that directly regulate time information. The physical properties and dynamics of proteins could generate “time” on various time scales as autonomous protein oscillators. The dynamics includes protein-protein interactions, post-translational modifications, enzymatic activities, and conformational changes.

The social implementation of academic research is expected to not only promote positive-feedback between basic science and industry/society but also provide new career paths for young researchers. Therefore, venture entrepreneurship from basic bioscience including biophysics can be a savior of Japan with a growing concern about the decline of scientific capabilities. In this symposium we would like to discuss the social implementation of basic bioscience from various viewpoints so as to encourage entrepreneurship among biophysicists, especially graduate students and young researchers. We hope audiences will see that basic science also has ample potential to venture out into a successful business/career.

Fumio Osawa, founder of the Biophysical Society, insightfully observed that the essence of life is "voluntary and spontaneous". The system principle that has evolved is form-dependent dynamics. Although we can raise issues from pathology, we are far from elucidating the "health principle" that allows us to live a 120-year lifespan. This symposium will explore the way to extend the principle of autonomy and spontaneity of life, which is emerged by self-association of protein fibers and led to adaptation by molecular chaperones, from molecules and cells to the physical and mental problems of human beings. We advocate health emergent science from biophysics.

The mechanical phenotype of cells is a key biophysical property that arises from the intracellular states at the molecular level and is associated with cellular function. In multiple cellular contexts, the mechanical phenotypes are coordinated for autonomous morphogenesis and functional maturation. In this symposium, we invite researchers from various fields, including engineering, computational biology, and basic biology, and showcase research attempts that focus on the mechanical phenotype for diagnosis purposes and for dissecting the dynamics of biological systems.

Life began from a mixture of chemicals in the early Earth environment, and eventually resulted in the emergence of functional cells by passing through intermediates such as assemblies and systems. However, nearly every aspect of this historical transition leading to the emergence of life remains unsolved. In this symposium, we will highlight research focusing on each step of the origins of life, with an attempt to develop and increase the resolution of origins of life studies to more accurately reveal the step-wise transition from non-life to life.

Genomic DNA contains the information necessary for the development and maintenance of living organisms, and forms cell-type-specific higher-order structures while exhibiting dynamic behavior. Recent studies, which employ live-cell imaging and mathematical and physical simulations, have revealed that these fluctuations in higher-order genomic structure play biological roles. In this symposium, experts in the field will present their latest research findings and discuss the functions of fluctuations in higher-order genomic structures.

2SCP シン・合成生物学：既存生命のみに依拠しないシステム創成に向けた化学者からの提案  
Material-driven biomimetic systems for a new paradigm of synthetic biology

Synthetic biology has recently made remarkable progress and is expected to be a discipline that will innovate medicine, agriculture, and industries. From the viewpoint of material sciences, however, the current synthetic biology seems to target systems that can work only under limited conditions within a very limited material framework allowed on our planet. In this symposium, we aim to discuss the synthesis of living creatures and the creation of new systems beyond the framework of existing organisms on Earth. We invite up-and-coming material scientists as speakers to build a new paradigm of synthetic biology and bring a new perspective to biophysics. We are convinced that this symposium will help to enable the evolution of living creatures beyond the framework of conventional biology and for the creation of life as yet unseen.

Extracellular fine particles including exogenous fine particle such as PM2.5 and endogenous fine particles such as extracellular vesicles (EVs) including exosomes, have generated significant attention due to their ability to induce crucial biological responses. For instance, EVs serve as mediators of intercellular communication. However, due to the heterogeneity of extracellular fine particles and the difficulty of separation, the molecular mechanisms underlying biological responses to these particles and their dynamics have been very controversial. To elucidate these mechanisms, it is imperative to characterize individual extracellular fine particles in living cells by microscopy. This symposium aims to focus on studies that uncover the behavior of extracellular fine particles by cutting-edge imaging techniques such as single-molecule/super-resolution imaging, lattice-light sheet microscopy, and scanning electron-assisted dielectric microscopy.

Time-resolved serial femtosecond crystallography (TR-SFX) using X-ray free electron laser can capture transient structures of proteins at work and thus is a powerful strategy to make Molecular Movies. However, complementary techniques are also required to interpret the obtained data and decipher the structural dynamics at an atomic resolution. In this symposium, we focus on the nonequilibrated dynamics of photoreceptive proteins revealed by various techniques, such as structural analyses, theoretical calculations, and time-resolved spectroscopy. We will discuss the latest outcomes and the future of time-resolved structural analyses including TR-SFX.

2SFP 多様なリズム現象から探る概日時計研究の行方

Future Direction of Circadian Clock Research from the Viewpoint of Diverse Rhythmic Phenomena

オーガナイザー：秋山 修志 (分子科学研究所), 寺内 一姫 (立命館大学)

Circadian clocks have three common characteristics: free-running oscillations, temperature compensation, and entrainment. While molecular bases for these three properties are being elucidated, the nature of the core oscillator and its diversity remain largely unexplored, and are being actively studied from approaches such as physiology, biophysics, and structural biology. In addition, in response to the growing interest in a style of "create to understand", some research is also being conducted from the perspective of how well sophisticated properties such as circadian clocks can be granted to soft matter. In this symposium, considering complex diversity and commonality found in cyanobacteria, duckweed, and artificial gels, we would like to discuss future approaches to elucidate the circadian clock systems.

Tremendous advances in the structural biology and pharmacology of GPCRs, coupled with rapid advances in computational approaches, have expanded our understanding of both structural and functional aspects of GPCR dynamics and GPCR-ligand or partner protein interactions, providing guidance for new structure-based drug design. The goal of this symposium is to expose scientists to recent discoveries and cross-disciplinary approaches utilized to study GPCRs and provide opportunities for establishing communications that bridge complementary interests in the field of GPCRs. This session will feature speakers who have made exciting discoveries about the molecular mechanisms of GPCRs and partner proteins involved in signal transduction by utilizing spectroscopic, structural biology, single molecule observations, and computational chemistry approaches.

Cryo-electron microscopy is a powerful tool to determine structures of biomolecules. Especially, it is suitable for those which are difficult to be crystallized such as flexible virus capsids, fibrils, or membrane proteins. In this symposium, young scientists challenging to solve structures of such complicated biomolecules will present their recent results. We will discuss how to solve problems that we encounter in the sample preparation and single-particle analysis.

In this symposium, we focus on five presentations for introducing the current progress of liquid-liquid phase separation of biomolecules or biomolecular systems. The presenters cover various approaches such as single-molecule microscopy, rheology, and molecular dynamics simulations. In addition, wide topics are discussed including enzymatic reactions in condensates, phase separating peptide design, and dynamics of molecules in condensates.

Science and technology feed each other, mutually driving progress in both fields. This symposium assembles leading developers and adopters of cutting-edge technology focused on cell-based, extracellular vesicle (EV)-based, and molecular-based phenotyping. By fostering insightful conversations and engaging presentations, we anticipate the emergence of synergistic and inventive connections among the various strata of biological systems. These include molecules (nucleic acids, peptides, proteins), biological particles (organelles, viruses, EVs), and cells (single cells, organoids).

Research on the bottom-up creation of cells has progressed substantially, resulting in reconstituted molecular systems that mimic various cellular functions and properties. However, the bottom-up construction of molecular systems aimed at goals of social implementation has been rarely developed. In this symposium, current research topics including applied and social development based on the basic research of unique molecular systems will be presented. We especially focus on advanced technologies such as cell-free protein synthesis, adhesive nanofiber proteins, and high-throughput single cell-screening.

Cells are the unit of living systems, regulating diverse biological processes. It has now become clear that mechanical factors such as the stiffness of intracellular and extracellular components allow cellular systems to function properly, while the whole picture of the mechanisms is yet poorly understood. In this symposium, we focus on the roles of mechanical factors in mediating cellular and subcellular processes and discuss how “mechanics” in such highly complex systems could be probed with techniques/technologies in physics and engineering. Specifically, recent studies from both experimental and theoretical approaches will be presented regarding the embryonic and fetal development and cellular biophysical homeostasis.

Movement is one of the fundamental characteristics of life. Although biophysical studies on molecular- and organelle-level motility have elucidated the mechanisms of biological movement, much remains unknown about behavior and its significance at the cellular level. In this symposium, we invite researchers to challenge the behavioral analysis of unicellular organisms and the techniques for capturing cell movement on a microscale. Through the presentations on various subjects including ciliates, amoebae, microalgae, and marine particles, we would like to discuss the behavior and survival strategies of unicellular organisms which are unique to microenvironments, aiming to establish the field of biophysics of behavior.

Liquid-liquid phase separation (LLPS) is driven by the dynamic assembly of diverse protein and RNA molecules in the cells. In order to understand how such droplets, which are seemingly disordered structures, regulate various physiological functions, it is necessary to quantitatively measure the behavior of LLPS at the atomic and molecular levels. In this symposium, we would like to introduce recent studies of researchers who are aiming to elucidate the principles of LLPS formation and the regulation of intracellular functions by structural biology approaches such as NMR and computational science, as well as chemical biology.

Recent progress in proteomics of human diseases and host-pathogen interactions has revealed that potential therapeutic targets contain intrinsically disordered regions (IDRs). Proteins with large amounts of IDRs often lack a fixed or ordered three-dimensional structure, rendering them unsuitable for the modern structure-guided drug discovery methodology. This symposium aims to explore different biophysical approaches to drug discovery and development against IDRs. We will focus on methods that go beyond the classical lock-and-key model, including innovative approaches to understand the structural and dynamic properties of IDRs.

Physical understanding of information in living systems lies at the leading edge of biophysical studies. The advances in super resolution microscopy and accurate manipulation and measurement techniques have highlighted various unexpected behaviors of molecules and cells under collective motion, which reveals that the essence of the information underlies in the precisely quantified data acquired under the “living” state. In this symposium, we introduce the attempts to investigate the dynamics of living systems in the intrinsic state and in response to the extrinsic stimulus to explore the principles of spontaneous generation, transmission, and processing of biological information.

To understand how cells work, biophysicists are now discovering the mechanisms by which mesoscale subcellular molecular complexes are formed and function. This approach, particularly that using advanced microscopic imaging methods, is turning out to be very fruitful. Meso-scale, often between 3 and 300 nm, is an interesting spatial scale where non-living nano-scale molecules are assembled to start exhibiting the clear features of micron-scale living cells. Furthermore, recent research advances on the liquid condensates are further activating meso-scale investigations. Therefore, this symposium will focus on this very hot topic of meso-scale structures/events, including liquid signaling platforms, myosin-motor-driven cargo-membrane sculpting, subsynaptic meso-domains, DNA breaks, and fundamental material properties of biomolecular condensates. We hope to make this symposium a place where, together with the audience, new fundamentally important ideas emerge toward the understanding of how subcellular meso-scale structures form and function.

How does a biomacromolecular complex like an enzyme work accurately and regulatory in water solvent system dominated by thermal fluctuations? The key to understand this question lies in the fact that, due to hydration, the thermal motions involved in biomolecular functions are temporally and spatially heterogeneous. For example, the collective intermolecular dynamics of protein and water molecules, which are overlapped in the sub-THz frequency region, may be relevant for expressing protein functions. In this symposium, we will attempt to discuss new directions regarding the unexplained phenomena in biomolecular functions based on the measurements of intermolecular dynamics, such as THz-TDS, fs-RIKES, microwave dielectric relaxation and NMR, and the physicochemical theoretical approach.

In biological activity, biomembranes participate in responses for acceptance/rejection of stimulation and structural formations including e.g., cellular uptake, migration, proliferation, and cell death. Understanding and controlling biophysical responses/mechanisms-based membrane systems are highly anticipated to be next-generation therapeutic methodologies for further achievements of disease regulation such as cancers. In this proposal symposium, advanced research technologies and achievements of visualizing and controlling membrane traffic, release of extracellular vesicles, self-organization of tissue formation, exploiting physics and physical chemistry for imaging and analysis of membrane characterization with antimicrobial peptides, biophysical assessment and biological applications (especially drug delivery) of membrane disruptive peptides from the fusion viewpoints of biophysics, molecular cell biology, chemistry, and chemical biology will be presented, and membrane-based therapeutic methodology will be discussed.

Photosynthetic organisms synthesize organic compounds from water and carbon dioxides using solar energy. They adapted and expanded over a wide range of environments and sustain all living organisms on Earth. The structure and function of photosynthetic apparatus change dynamically in response to environmental conditions. In 2023, researchers from structural biology, plant physiology, biochemistry, and bioinformatics have teamed up to launch a new research project, "Photosynthetic Ubiquity", which is supported by Grant-in-Aid for Transformative Research Areas (A) from JSPS. In this symposium, the members of this project will discuss approaches to elucidate the molecular principles of adaptation of photosynthetic supramolecular complexes to diverse environments.

The recent discovery of new microorganisms with extraordinary characteristics has extended the possibility of living organisms on Earth. Similarly, the recent synthesis of artificial cellular and non-cellular systems has revealed what life could potentially be. As a result of these studies, we have come to realize that the potential of living systems on Earth, including human beings, is much greater than previously thought. In this symposium, we have invited researchers who are actively studying microorganisms in extraordinary habitats or synthesizing artificial systems with extraordinary properties. We hope that this symposium will provide an opportunity for researchers from different fields to broaden their perspectives on living things.

ランチョンセミナー BP-1 Presented by ZEISS

## 超解像領域でのイメージングから一分子レベルの挙動を捉える New modified confocal based super resolution technique Airyscan 2 and Airyscan based FCS technology Dynamics Profilerのご紹介

ZEISS共焦点レーザ顕微鏡ベース超解像技術 Airyscan はその発表以来、誰もが気軽に使える超解像手法として、広がり進化を遂げてきました。Airyscan 2となり、新たなプロセス Joint Deconvolutionとのコンビネーションで最大分解能は90nm (XY) と大きく飛躍しました。

Airyscanの技術を次のステップ進めるDynamics Profilerがこの度登場しました。現在、Fluorescence Correlation Spectroscopy (FCS) は一分子の動態解析に広く用いられています。しかし、その概念やデリケートな設定などから嫌厭される方もいらっしゃるのではないのでしょうか？そこで、これまでの問題点を解決し、分子レベルの挙動解析を多くのイメージングユーザの方が利用できるように工夫したのがDynamics Profilerです。

さらに、Dynamics Profiler では、32 ch で構成された Airyscan 検出器の特性を活かし、分子の点領域内での動きまで導き出すことができます。これにより、近年話題の液-液層分離、膜構造のない境界面での拡散ダイナミクスの測定や分子のフロー解析など新たなソリューションをご提供します。

本セミナーでは超解像から分子動態解析まで可能になった Airyscan 2 Dynamics Profilerをご紹介します。

### セミナー内容

Gタンパク質共役型受容体（GPCR）は、ヒトでは約800種類もあることが知られており、機能も多岐にわたるため、生命現象を理解するうえでカギとなる分子の一つである。近年、GPCRは従来の知見と異なり、寿命約100ミリ秒の動的なダイマーを最小単位とする会合体を形成することが分かってきた。さらに、ダイマーがシグナル生成に関わる等、会合体形成によるシグナル制御の機構の一端も明らかになりつつある一方で、会合体形成の一般性や、生体内での実際の働きや意義については、未だ不明な点が多い。私たちは、qCMOSカメラをはじめとした様々な高感度カメラを用いた細胞内蛍光1分子観察技術によって、こうした疑問に答えようとするアプローチを続けており、本発表では最近の知見をご紹介します。

1センチ角（光路長1センチ）の石英セルを用いる古典的分光装置は現行の生物蛍光スペクトル測定に妙な束縛をかけている。すなわち内部遮断効果の排除を理由に測定対象を希薄溶液に限定している。しかしながら細胞質をはじめ細胞内各コンパートメントの中味は理想溶液からほど遠い。molecular crowdingの名のとおり高濃度の生体高分子を含む濃厚水溶液であり、さらに必ずしも均一系ではなく、液-液相分離にもとづく混合系であり、凝集体（固体）を伴う液体としての凝縮系でもある。こうした生物の複雑万丈をなるべく反映した状況で蛍光標識分子の挙動を解析する方法として堀場製作所の蛍光吸光分光装置Duettaの活用を推奨してみたい。True FRET（無放射性）をTrivial FRET（放射性）から区別する目的でも使える。当該分光装置の吸光分光と蛍光分光は決して $1+1=2$ の関係にはない。

## Protein Data Bank: From Two Epidemics to the Global Pandemic to mRNA Vaccines and Paxlovid

Stephen K. Burley, M.D., D.Phil.

RCSB Protein Data Bank, Institute for Quantitative Biomedicine, Department of Chemistry and Chemical Biology, Rutgers, The State University of New Jersey and  
RCSB Protein Data Bank, San Diego Super Computer Center, University of California, San Diego

Structural biologists and the Protein Data Bank (PDB) played decisive roles in combatting the COVID-19 pandemic. This talk will explain how global three-dimensional (3D) biostructure data was turned into global knowledge, allowing scientists and engineers around the world to understand the inner workings of coronaviruses and develop effective countermeasures against SARS-CoV-2.

State-of-the-art mRNA vaccines, initially designed with guidance from single-particle cryo-electron microscopy structures of the SARS-CoV and MERS Spike Proteins, benefited more than five billion individuals around the world by preventing viral infections entirely or significantly reducing morbidity and mortality. Structure-guided drug discovery efforts at Pfizer, first initiated in the 2000s in response to the SARS-CoV epidemic and reactivated in 2020 early in the global pandemic, yielded nirmatrelvir - a potent, orally-bioavailable, covalently-acting, peptidomimetic inhibitor of the SARS-CoV-2 Main Protease. This targeted anti-viral drug received Emergency Use Authorization from the United States Food and Drug Administration in December 2021, less than two years following public release of the viral genome sequence. It is used clinically for the treatment of acute SARS-CoV-2 infections in a fixed dose combination with ritonavir and sold under the brand name Paxlovid.

Biomedicine and biotechnology delivered! Bolstered by open access to research data generated with public and private monies, particularly 3D structures of coronavirus proteins and their complexes with one another, with antibodies, and with small-molecule inhibitors archived in the PDB, basic and applied researchers made a difference that made a difference when the world desperately needed them to succeed. To underscore the importance of these contributions, I quote Dr. Anthony Fauci, former head of the National Institute of Allergy and Infectious Disease, "Show me a person who's vaccinated, got infected, took Paxlovid and died. I can't find anybody."

# 高効率の蛋白質Dynamics解析に向けた Mass photometry

レフェイン・ジャパン株式会社 志波公平

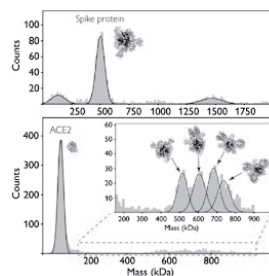

近年より蛋白質の立体構造の重要性が議論され出し、CryoEMなどの解析ツールが実際に蛋白質研究に活用され出して、蛋白質のDynamics解析への注目がさらに高まっている。Dynamics解析を行う上で、解析される対象試料調製などの精度向上が要求される。このことは、例えば実際に複合体解析を行う場合、用いる試料が正しく複合体を形成しているかどうかを知ったうえで測定するのかどうかということとなり、仮にわからない状況で解析を行うことで多くの工数を無駄にしてしまうことにつながる。

Mass photometry法（以下、MP法）は、英国のOxford大学で開発された手法で、極微量の試料量で分子量分布を獲得することができる技術である。当社ではMP法を用いた分析装置の開発・製造・販売・サポートを行っている。今回の発表では、MP法を用いた蛋白質の溶液中Dynamicsに向けたアプリケーション事例を紹介するとともに、実際の研究においてどの程度効率化が図れるのかについても触れる予定である。また、複合体解析に欠かせない分子間相互作用解析についても、その定量評価手法（ $K_D$ 算出）を交えて紹介したい。

I will show how an in-depth description of the basic principles of diffraction-unlimited fluorescence microscopy has spawned MINFLUX [1-4], a recent super resolution method that has reached the resolution of the size of a fluorophore molecule. Providing 1–3 nanometer resolution in fixed and living cells, as well as localization precisions in the Angström range, MINFLUX and the related MINSTED concept [5,6] are being established for routine applications in the biomedical sciences [4]. Relying on fewer fluorescence photons than other methods, these techniques are also poised to characterize dynamic processes at the single protein level, as already demonstrated by tracking sub(nanometer) details of the unhindered stepping of the motor protein kinesin-1 on microtubules at up to physiological ATP concentrations [7].
